The Missing Link - Lose Weight, Live Longer

Has the time come to reconsider guidelines for bariatric surgery? In addition to the improvement in the risk of diabetes, the reduction in deaths from cancer may also argue in this direction.

Thus the question as to whether intentional weight loss improves life span has been answered, and the answer appears to be a resounding yes.

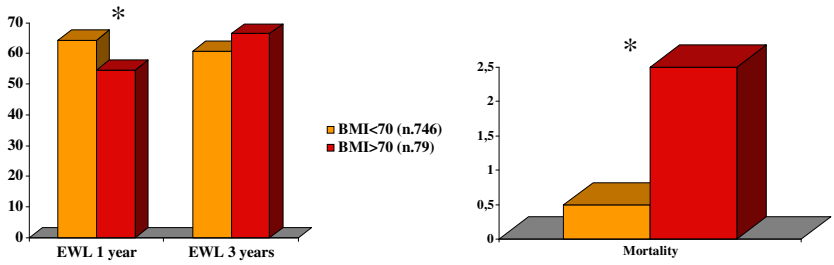
JOURNAL OF GASTROINTESTINAL SURGERY

Roux-en-Y gastric bypass stratified by a BMI of 70 kg/m²



Raftopoulos, 2005

Adolescents Being Considered for Bariatric Surgery Should:

-Have failed 6 months of organized attempts at weight management

-Have attained or nearly attained physiologic maturity

-Be very severely obese (BMI 40) with serious obesity-related comorbidities or have a BMI of 50 with less severe comorbidities

-Demonstrate commitment to comprehensive medical and psychologic evaluations both before and after surgery

- Agree to avoid pregnancy for at least 1 year postoperatively

-Be capable of and willing to adhere to nutritional guidelines postoperatively. Demonstrate decisional capacity

-Have a supportive family environment

DM, type 2 diabetes mellitus; HTN, systemic hypertension; DJBD, degenerative joint and back disease; GERD, gastroesophageal reflux disease; SAS, sleep apnea syndrome; OHS, obesity hypoventilation syndrome; CVSD, chronic venous stasis disease; PC, pseudotumor cerebri; UI, urinary incontinence.
*$P < 0.05$, †$P < 0.01$ patients < 60 vs. ≥ 60 years of age.
‡SAS patients did not have routine follow-up sleep polysomnography.

The American Journal of CLINICAL NUTRITION

Obesity in older adults: technical review and position statement of the American Society for Nutrition and NAASO, The Obesity Society

Bariatric surgery should be considered in selected older subjects who have disabling obesity that can be ameliorated with weight loss and who meet the criteria for surgery. The specific bariatric surgical procedure that is performed will depend on the skill and experience of the surgeon. Potential surgical candidates should be carefully evaluated by a multidisciplinary team to ensure that the risk of postoperative morbidity and mortality is acceptable and that the perceived benefits of the procedure warrant the risk of potential complications. Preoperative evaluation should include an assessment for clinical depression, which occurs in up to 25% of older subjects (205) and could influence outcome. Postoperative management should include monitoring for nutrition-related abnormalities, particularly iron deficiency, vitamin B-12 deficiency, and osteoporosis.

Predictors of response

Demographic—Age, sex, race, marital status, education, job, insurance
Physiological—Body mass index, body composition (fat cell size, fat distribution, lean body mass), metabolic rate (resting, total, diet*), blood chemistry
Comorbidity—Diabetes, hypertension, cardiopulmonary disease, sleep apnoea, musculoskeletal disorders, thromboembolism
Psychological—MMPI disorder,† sexual abuse, negative life experience, secondary gain, codependency, denial of disease
Past performance—Weight loss, smoking cessation, attendance at appointments, drug and alcohol use
Eating behaviour—Eating sweets, nibbling, gorging, binge eating, restrained eating, poor impulse control

*Diet induced thermogenesis.
†According to Minnesota multiphasic personality inventory

GUIDELINES FOR GRANTING PRIVILEGES IN BARIATRIC SURGERY

Rev. October 2005

-Accredited* facility to perform gastrointestinal and biliary surgery

-Documented integrated program (nursing, dietary, support groups, exercise training, psychological assistance)

-Program in place to prevent, monitor and manage short-term and long-term complications.

-Provide follow-up for all patients

(*) center: 125 operations/year
individual surgeon: 50/year

THE OBESITY SOCIETY

…NAASO applauds CMS for requiring that bariatric surgery centers "have [an] integrated program for the care of the morbidly obese patient that provides ancillary services such as specialized nursing care, dietary instruction, counseling support groups, exercise training, and psychological assistance as needed".

It is critical that CMS authorize payment for each of the therapies listed, as well as for others that may be required
